Final Evaluation – Web Development with Django

Aitor González

This project will count for **half of the final grade** and must be completed **in pairs**.

Your project can be performed with **Django or any other web framework**, but it must be a **web application** that retrieves data from a database and displays it on a website.

Objective

The objective is to develop a **Django website** with a level of complexity similar to the project completed in class about movies.

Criteria to obtain a passing grade

To obtain a passing grade, your website must meet **at least** the following criteria:

- A website with **at least two different pages**, connected by links.
- The data must be **stored in a relational database**.
- The pages must **retrieve their data from a database**.
- The pages must **use templates**.

To go further and obtain a better grade

You can improve your grade by integrating the following elements:

- **Multiple tables** in the database with **many-to-many relationships**.
- A **sign-up and login system** protecting part of the application or user-based data.
- **An original website and elements**: propose a unique theme and a well-designed layout.
- **A user-friendly experience**, with smooth navigation and well-organized information.
- Some javascript to enhance the user experience, such as **dynamic content loading** or **interactive elements**.

- **A DataTable or an equivalent structure** for user-friendly data presentation.

Project Presentation

The application will be presented to the teachers **during a dedicated session**. During that session, you will present your project, answer questions, and demonstrate its functionality. Eventually, you will be requested to show the code. No formal powerpoint is required but please organize your time in advance to ensure you can cover all the necessary points within the allocated time.
